

# Testbench for Sequential Circuit

Sequential circuit testbenches are similar to those for combinational circuits but include additional inputs like Clock and Reset. Clock signals require a separate process statement, while the reset signal can be configured as needed.

```
library ieee;
use ieee.std_logic_1164.all;

entity up_down_counter is
    port (
        clk : in std_logic;
        rst : in std_logic;
        up_down : in std_logic;
        count : out std_logic_vector(3 downto 0)
    );
end up_down_counter;

architecture rtl of up_down_counter is
begin
    process(clk, rst)
    begin
        if rst = '1' then
            count <= "0000";
        elsif rising_edge(clk) then
            if up_down = '1' then
                count <= count + 1;
            else
                count <= count - 1;
            end if;
        end if;
    end process;
end rtl;
```

In this case, a synchronous up/down counter is tested with a testbench combining all three architecture models. The Clock uses a process statement, and Reset uses a simple assignment. Inputs are declared upfront as they do not change during the simulation.

```
library ieee;
use ieee.std_logic_1164.all;

entity testbench is
end testbench;

architecture tb_arch of testbench is
    signal clk : std_logic := '0';
    signal rst : std_logic := '0';
    signal up_down : std_logic := '0';
    signal count : std_logic_vector(3 downto 0);

    component up_down_counter
        port (
            clk : in std_logic;
            rst : in std_logic;
            up_down : in std_logic;
            count : out std_logic_vector(3 downto 0)
        );
    end component;

begin
    UUT_inst : up_down_counter
        port map (
            clk => clk,
            rst => rst,
            up_down => up_down,
            count => count
        );

    -- Clock process
    clk_process : process
    begin
        clk <= not clk;
        wait for 10 ns;
    end process;
```

```
-- Apply stimulus to the UUT
```

```
up_down <= '1';
```

```
wait for 10 ns;
```

```
up_down <= '0';
```

```
wait for 10 ns;
```

```
rst <= '1';
```

```
wait for 10 ns;
```

```
rst <= '0';
```

```
wait for 10 ns;
```

```
wait;
```

```
end tb_arch;
```
